

Magic Speed 3.6

Your PC is slow in boot-up and running? Magic Speed will make your PC faster and more efficient in 5 simple steps. The software package includes startup management, fixing registry errors, Disk clean-up, and memory management. It does not require special PC knowledge!

Magic Speed will analyze your applications, which are loaded with your PC boot-up. Are you sure that you really need these applications? When loaded, they occupy PC memory and slow down PC operation. A check-up will also include virus and spyware tests thanks to a new anti-virus engine updated on a daily basis.

Registry errors also negatively affect PC efficiency. By deleting temporary files, you will increase free space on your hard drive and speed up its operation. Make use of the unique Boost Windows option - by adding it to the startup you will discover a great improvement to your PC operation!
